

## **Bi-Weekly Report of (Team #13)**

Week #8

### What were the goals for the last 2 weeks?

- -Create an algorithm that reflects other features in addition to self-introduction in the recommendation algorithm
- -Create data interface with modeling and API design
- -Help create an algorithm and create a data interface with modeling
- -Finish the Figma model and share it with team members

### What goals were accomplished this week?

#### [Data preprocessing]

```
def generate_introduction(jobs, personalities, likes, num_sentences):
    introductions = []
    for _ in range(num_sentences):
        job = random.choice(jobs)
        personality = random.choice(personalities)
        like = random.choice(likes)
        introductions.append(f"나는 {job}이다. 나의 MBTI는 {personality}이다. 나는 {like}을(를) 좋아한다.")
    return introductions
```

```
jobs = [ "음악가", "작곡가", "가수", "DJ", "음향 엔지니어", "게임 개발자", likes = [ "화초 돌보기", "동물 돌보기", "새 관찰", "별보기", "천문학", "지리학", "역사 탐구", "문화 탐구",
```

The code that was written previously allowed people under the age of 10 to have a variety of jobs, but the code was modified to limit the occupation of people under the age of 10 to be a student. It seemed like the occupations were too focused on professionals, so we increased the diversity of occupations by adding more diverse occupations such as DJs and craftsmen. Hobbies also seemed to be focused on sports, so I added humanistic hobbies such as writing poetry and watching musicals.

#### [Recommendation system]

- recommend 10 top users based on content based recommendation
  - filtered by mother tongue language, language to learn, gender, language level
  - self-introduction embedding with TfidfVectorizer and stopword preprocessing
  - cosine similarity between self-introduction (e.g. job, MBTI, hobby)
  - it can resolve the cold start problem, which can make recommendation possible without knowing who the user likes.

```
499,Addisynn,남,30대,나는 음악가이다. 나의 MBTI는 INFJ이다. 나는 스탬프 수집을(를) 좋아한다.,영어,일어,하 500. Addlee,여,30대,나는 특수교육 교사이다. 나의 MBTI는 ENFP이다. 나는 글쓰기을(를) 좋아한다.,한국어,중국어,상 501,Addley,여,60대 이상,나는 해양생물학자이다. 나의 MBTI는 ESTP이다. 나는 천문학을(를) 좋아한다.,영어,일어,상
```

Example Input: User\_ID 500, Addlee wants user who is male, has high level language, has mother tongue she wants to learn.

#### Output:

```
User ID
                                                   게

## **Capstone Design**

### [Backend]

- Collect and store user data with sign-up.
  Login authentication/authorization via jwt cookie issued.
- Logout process.
- Multiple endpoint settings.
  Distribute user lists through render-template.

### [Frontend]

Design for the authentication and sign up, log in.

### Reflect critically on any goals not accomplished.

### [Recommendation System]

- When MBTI enters the hobby, it seems that more meaningful results will come out if it is recommended considering MBTI compatibility, but considering its reliability and unwanted users, only natural language similarity has been applied for now. We will decide again whether to apply this later.

#### [Backend]

- Postpone interface with Modeling.
- data management via reference keys.

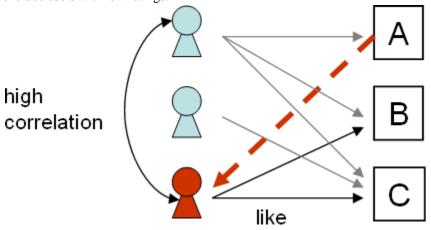

### [Frontend]

- The design needs improvement.
- Improvement in user affinity should be made.

### What are the goals for the next two weeks?

### [Recommendation system]

- will apply an item collaborative filter with a rating function to reflect the taste of the user
  - and will create rating data (like, dislike, NA)
  - after rating the 10 recommended users above, there will be users(A,B,C) with high ratings. Re-recommend other users(A) selected by the user who gave that user(A) a high rating and exclude users with low ratings.

#### [Data Preprocessing]

The data pre-processing process to be used in the service seems to have been roughly completed, so we will consider how to run the recommendation service more efficiently using this data.

#### [Backend]

- Chatting function with translation API.
- Friend Request/Accept function.
- Find face-talk, and audio translation features.

#### [Frontend]

- Develop design in more detail
- Improve code

# **Capstone Design**

# Weekly Report # 2

# How many hours were spent on each goal noted above?

## Recommendation system

- 20 hours per two weeks

### Data preprocessing

- 5 hours per two weeks

#### Backend

- 5 hours per two weeks

#### Frontend

- 5 hours per two weeks
